Bike systems through the time

According to [hs04], we can classify a bike system as:

- **First generation:** White bike program at Amsterdam, 1964. You could pick a bike and leave it in any place.
- **Second generation:** City Bikes program at Copenhagen, 1995. You could pick up and deliver a bike from specific places by a coin deposit.
- **Third generation:** Bikeabout program at Portsmouth University, England 1996. You could pick up a bike using a magnetic card.
- **Fourth generation:** Call a Bike program at Germany, 2000. You need a digital authentication to lock or unlock a bike.

- **Balancing Methods:** Balancing operations to ensure the system sustainability, [Fis16]-[SHv17].
- **Underused systems:** Research why people decided to don't use the service, [Fis16].
- **Interaction between car drivers and bike users:** Research the behavior of car drivers towards bike users to implement security measures, [Fis16].

- **Quantitative metrics:** Research and development of quantitative metrics to measure the impact of the bike sharing systems in terms of vehicular transit and environment pollution, [Fis16].
- **Demand prediction:** It is necessary to know the demand of the system to maintain the system. The prediction of the demand is an input to other type of analysis, [SHv17].

Bike sharing System in Mexico City

The bike sharing system of the Mexico city, called Ecobici, started operations in February of 2010, [htt10].

- This is a 3rd generation system.
- It consists of 480 bike-stations spread around the Mexico city.
- By paying a membership, any user can take a bike for 45 minutes on a schedule between the 05:00 and 00:30 hrs of the next day.

The information is public and can be consulted in the web page of the service. The captured information by the system is the following:

- Genero_Usuario
- Edad_Usuario
- Bici
- Ciclo_Estacion_Retiro
- Ciclo_Estacion_Arribo
- Fecha_Retiro
- Fecha_Arribo
- Hora_Retiro
- Hora_Arribo

Identified problems with the data

- 1 The information is reported at service level, i.e, we never know how many bikes are in each station at any moment.
- 2 The information is reported at the end of each month in the web site.

To face the problem that the information is reported at the end of each month, we analyzed the historical data to identify certain patterns. For each station c , We analyzed the flow of arrivals minus withdrawals of bikes divided by the total capacity of the station, k , as following:

$$I_t^c = \frac{A_t - R_t}{k} + C_0, \quad (1)$$

- A_t are the bike arrivals until time t .
- R_t are the bike withdrawals until time t .
- C_0 is a constant between 0 and 1.

Station Identification // Equilibrium Station

Bike-station: 49

Station Identification // Saturate Station

Bike-station: 117

Station Identification // Empty Station

Station Identification // Not a clear pattern

Bike-station: 462

Demand and Supply estimates

We took the average arrivals and withdrawals over a time window of thirty minutes as the estimates of the supply and demand, respectively.

A) Bike-station with many arrivals at 08:00-08:30.

B) Bike-station with many withdrawals at 08:30-09:00.

Bootstrap Intervals for station 107

Confidence intervals at 95% for the mean of Arrivals

Confidence intervals at 95% for the mean of Withdrawals

Bootstrap Intervals for station 117

Confidence intervals at 95% for the mean of Arrivals

Confidence intervals at 95% for the mean of Withdrawals

Balancing exercise at 08:00-09:00

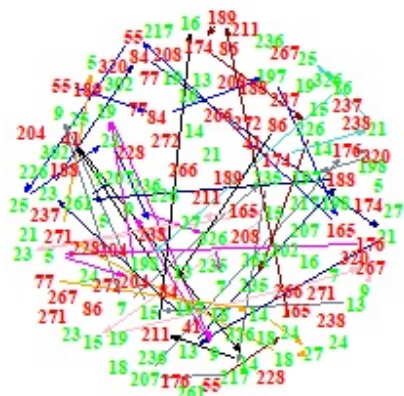

Time	DR	DA	%DA
08:30:00	151	136	90%

Table: Attended demand

Time	KM	T
08 : 00 – 09 : 00	6.1	36.6

Table: Average distance and time

Balancing exercise at 18:00-19:00

Time	DR	DA	%DA
18:30:00	191	145	75%

Table: Attended demand

Time	KM	T
18 : 00 – 19 : 00	9.2	55.4

Table: Average distance and time

Conclusions

- The bike systems have generated complex data sets.
- Many areas of interest requires the estimation of the demand and supply of bikes, so is of interest having accurate methods to estimate these quantities.
- The velocity at which a vehicle can move through the city is of interest.
